(54) Title: A PDE 4 INHIBITOR AND AN ANTI-CHOLINERGIC AGENT IN COMBINATION FOR TREATING OBSTRUCTIVE AIRWAYS DISEASES

(57) Abstract: The present invention relates to a combination of a selective PDE4 inhibitor and an anticholinergic agent for simultaneous, sequential or separate administration by the inhaled route in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.

A PDE 4 INHIBITOR AND AN ANTI-CHOLINERGIC AGENT
IN COMBINATION FOR TREATING
OBSTRUCTIVE AIRWAYS DISEASES

5 The present invention relates to an inhaled combination of a selective PDE4 inhibitor and an anticholinergic agent, with the proviso that the anticholinergic agent is not a tiotropium salt. The invention further relates to pharmaceutical compositions, including devices for administering, and to the uses of such a combination.

10

A combination of a selective PDE4 inhibitor and an anticholinergic agent is useful in the treatment of obstructive airways and other inflammatory diseases, particularly the obstructive airways diseases asthma, chronic obstructive pulmonary disease (COPD) and other obstructive airways diseases exacerbated
15 by heightened bronchial reflexes, inflammation, bronchial hyper-reactivity and bronchospasm. The combination is especially useful in the treatment of COPD.

Examples of particular diseases that may be treated with the present invention include the respiratory diseases asthma, acute respiratory distress syndrome,
20 chronic pulmonary inflammatory disease, bronchitis, chronic bronchitis, chronic obstructive pulmonary (airway) disease and silicosis and diseases of the immune system such as allergic rhinitis and chronic sinusitis.

The 3',5'-cyclic nucleotide phosphodiesterases (PDEs) comprise a large class of
25 enzymes divided into at least eleven different families which are structurally, biochemically and pharmacologically distinct from one another. The enzymes within each family are commonly referred to as isoenzymes, or isozymes. A total of more than fifteen gene products is included within this class, and further diversity results from differential splicing and post-translational processing of
30 those gene products. The present invention is primarily concerned with the four gene products of the fourth family of PDEs, *i.e.*, PDE4A, PDE4B, PDE4C, and PDE4D. These enzymes are collectively referred to as being isoforms or subtypes of the PDE4 isoenzyme family (PDE4s).

PDE4s are characterized by selective, high affinity hydrolytic degradation of the second messenger cyclic nucleotide, adenosine 3',5'-cyclic monophosphate (cAMP), and by sensitivity to inhibition by rolipram. A number of selective inhibitors of the PDE4s have been discovered in recent years, and beneficial pharmacological effects resulting from that inhibition have been shown in a variety of disease models: see, e.g., Torphy *et al.*, *Environ. Health Perspect.* **102** Suppl. 10, 79-84, 1994; Duplantier *et al.*, *J. Med. Chem.* **39** 120-125, 1996; Schneider *et al.*, *Pharmacol. Biochem. Behav.* **50** 211-217, 1995; Banner and Page, *Br. J. Pharmacol.* **114** 93-98, 1995; Barnette *et al.*, *J. Pharmacol. Exp. Ther.* **273** 674-679, 1995; Wright *et al.* "Differential *in vivo* and *in vitro* bronchorelaxant activities of CP-80633, a selective phosphodiesterase 4 inhibitor," *Can. J. Physiol. Pharmacol.* **75** 1001-1008, 1997; Manabe *et al.* "Anti-inflammatory and bronchodilator properties of KF19514, a phosphodiesterase 4 and 1 inhibitor," *Eur. J. Pharmacol.* **332** 97-107, 1997; and Ukita *et al.* "Novel, potent, and selective phosphodiesterase-4 inhibitors as antiasthmatic agents: synthesis and biological activities of a series of 1-pyridyl-naphthalene derivatives," *J. Med. Chem.* **42** 1088-1099, 1999.

Anticholinergic agents prevent the effects resulting from passage of impulses through the parasympathetic nerves. This action results from their ability to inhibit the action of the neurotransmitter acetylcholine by blocking its binding to muscarinic cholinergic receptors. There are at least three types of muscarinic receptor subtypes. M₁ receptors are found primarily in brain and other tissue of the central nervous system, M₂ receptors are found in heart and other cardiovascular tissue and M₃ receptors are found in smooth muscle and glandular tissues. The muscarinic receptors are located at neuroeffector sites on, e.g., smooth muscle and, in particular, M₃-muscarinic receptors are located in airway smooth muscle. Consequently, anti-cholinergic agents may also be referred to as muscarinic receptor antagonists.

30

The parasympathetic nervous system plays a major role in regulating bronchomotor tone, and bronchoconstriction is largely the result of reflex increases in parasympathetic activity caused in turn by a diverse set of stimuli.

- Anti-cholinergic agents have a long history of use in the treatment of chronic airway diseases characterised by partially reversible airway narrowing such as COPD and asthma and were used as bronchodilators before the advent of epinephrine. They were thereafter supplanted by β -adrenergic agents and methylxanthines. However, the more recent introduction of ipratropium bromide has led to a revival in the use of anti-cholinergic therapy in the treatment of respiratory diseases. There are muscarinic receptors on peripheral organ systems such as salivary glands and gut and therefore the use of systemically active muscarinic receptor antagonists is limited by side-effects such as dry mouth and constipation. Thus the bronchodilatory and other beneficial actions of muscarinic receptor antagonists is ideally produced by an inhaled agent which has a high therapeutic index for activity in the lung compared with the peripheral compartment.
- Anti-cholinergic agents also partially antagonize bronchoconstriction induced by histamine, bradykinin, or prostaglandin $F_{2\alpha}$, which is deemed to reflect the participation of parasympathetic efferents in the bronchial reflexes elicited by these agents.
- It has now been surprisingly found that a combination of a selective PDE4 inhibitor and an anticholinergic agent offers significant benefits in the treatment of obstructive airways and other inflammatory diseases over treatment with either agent alone. The advantage of the combination is to provide optimal control of airway calibre through the mechanism most appropriate to the disease pathology, namely muscarinic receptor antagonism, together with effective suppression of inappropriate inflammation. By administering a combination of an anticholinergic agent and a selective PDE4 inhibitor via the inhaled route, the benefits of each class are realised without the unwanted peripheral effects. Further, the combination results in unexpected synergy, producing greater efficacy than maximally tolerated doses of either class of agent used alone.

The invention therefore provides an inhaled combination of a selective PDE4 inhibitor and an anticholinergic agent, with the proviso that the anticholinergic agent is not a tiotropium salt.

Further, the invention provides an inhaled combination of a selective PDE4 inhibitor and an anticholinergic agent for use as a medicament, with the proviso that the anticholinergic agent is not a tiotropium salt.

5

Further, the invention provides an inhaled combination of a selective PDE4 inhibitor and an anticholinergic agent for simultaneous, sequential or separate administration in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.

10

Further, the invention provides a pharmaceutical composition comprising a selective PDE4 inhibitor, an anticholinergic agent and a pharmaceutically acceptable excipient, diluent or carrier, for administration by the inhaled route in the treatment of an obstructive airways or other inflammatory disease, with the

15

proviso that the anticholinergic agent is not a tiotropium salt.

Further, the invention provides the use of a selective PDE4 inhibitor or an anticholinergic agent in the manufacture of a medicament for simultaneous, sequential or separate administration of both agents by the inhaled route in the

20

treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.

Further, the invention provides a method of treating of an obstructive airways or other inflammatory disease comprising administering simultaneously,

25

sequentially or separately, by the inhaled route, to a mammal in need of such treatment, an effective amount of a selective PDE4 inhibitor and an anticholinergic agent, with the proviso that the anticholinergic agent is not a tiotropium salt.

30

Further, the invention provides an inhalation device for simultaneous, sequential or separate administration of a selective PDE4 inhibitor and an anticholinergic agent in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.

A selective PDE4 inhibitor is one that has a greater affinity for the PDE4 isoenzyme than all other known PDE isoenzymes. Preferably, the affinity of a selective PDE4 inhibitor according to the invention is at least 100 fold greater for the PDE4 isoenzyme as compared with its affinity for the other PDE isoenzymes.

5

Suitable selective PDE4 inhibitors for use in the invention include the compounds generally and specifically disclosed in WO-A-96/39408.

Such suitable PDE4 inhibitors include a compound of the formula (I)

10

15 or a pharmaceutically acceptable salt or solvate thereof, wherein:

R^1 is H, (C_1-C_6) alkyl, (C_1-C_6) alkoxy, (C_2-C_4) alkenyl, phenyl, $-N(CH_3)_2$, (C_3-C_6) cycloalkyl, (C_3-C_6) cycloalkyl (C_1-C_3) alkyl or (C_1-C_6) acyl, wherein the alkyl, phenyl or alkenyl groups may be substituted with up to two -OH, (C_1-C_3) alkyl, or $-CF_3$ groups or up to three halogens;

20 R^2 and R^3 are each independently selected from the group consisting of H, (C_1-C_{14}) alkyl, (C_1-C_7) alkoxy (C_1-C_7) alkyl, (C_2-C_{14}) alkenyl, (C_3-C_7) cycloalkyl, (C_3-C_7) cycloalkyl (C_1-C_2) alkyl, a saturated or unsaturated (C_4-C_7) heterocyclic $(CH_2)_n$ group wherein n is 0, 1 or 2, containing as the heteroatom one or two of the group consisting of oxygen, sulfur, sulfonyl, 25 nitrogen and NR^4 where R^4 is H or (C_1-C_4) alkyl; or a group of the Formula (II):

wherein a is an integer from 1 to 5; b and c are 0 or 1; R^5 is H, -OH, (C_1-C_5) alkyl,

(C₂-C₅) alkenyl, (C₁-C₅) alkoxy, (C₃-C₆) cycloalkoxy, halogen, -CF₃, -CO₂R⁶,
 -CONR⁶R⁷, -NR⁶R⁷, -NO₂, or -SO₂NR⁶R⁷ wherein R⁶ and R⁷ are each
 independently H, or (C₁-C₄) alkyl; Z is -O-, -S-, -SO₂-, -CO- or -N(R⁸)- wherein R⁸
 is H or (C₁-C₄) alkyl; and Y is (C₁-C₅) alkylene or (C₂-C₆) alkenylene optionally
 5 substituted with up to two (C₁-C₇) alkyl or (C₃-C₇) cycloalkyl groups; wherein each
 of the alkyl, alkenyl, cycloalkyl, alkoxyalkyl or heterocyclic groups may be
 substituted with 1 to 14, preferably 1 to 5, (C₁-C₂) alkyl, CF₃, or halo groups; and
 R⁹ and R¹⁰ are each independently selected from the group consisting of H,
 (C₁-C₆) alkyl, (C₁-C₆) alkoxy, (C₆-C₁₀) aryl and (C₆-C₁₀) aryloxy.

10

Preferred compounds of the formula (I) include those wherein R¹ is methyl, ethyl
 or isopropyl and those wherein R³ is (C₁-C₆) alkyl, (C₂-C₆) alkenyl, (C₃-C₇)
 cycloalkyl, (C₃-C₇)cycloalkyl(C₁-C₆)alkyl or phenyl optionally substituted with 1 or
 2 of the group consisting of H, -OH, (C₁-C₅) alkyl, (C₂-C₅) alkenyl, (C₁-C₅) alkoxy,
 15 halogen, trifluoromethyl, -CO₂R⁶, -CONR⁶R⁷, -NR⁶R⁷, -NO₂ or -SO₂NR⁶R⁷
 wherein R⁶ and R⁷ are each independently H or (C₁-C₄) alkyl.

Preferred individual compounds of the formula (I) include:

9-cyclopentyl-5,6-dihydro-7-ethyl-3-phenyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3-
 20 α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(furan-2-yl)-9H-pyrazolo[3,4-c]-1,2,4-
 triazolo[4,3-α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-pyridyl)-9H-pyrazolo[3,4-c]-1,2,4-
 triazolo[4,3-α]pyridine;

25 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(4-pyridyl)-9H-pyrazolo[3,4-c]-1,2,4-
 triazolo[4,3-α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(3-thienyl)-9H-pyrazolo[3,4-c]-1,2,4-
 triazolo[4,3-α]pyridine;

30 3-benzyl-9-cyclopentyl-5,6-dihydro-7-ethyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3-
 α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-propyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

3,9-dicyclopentyl-5,6-dihydro-7-ethyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

- 5 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(1-methylcyclohex-1-yl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

3-(*tert*-butyl)-9-cyclopentyl-5,6-dihydro-7-ethyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

- 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-methylphenyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;
- 10

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-methoxyphenyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(thien-2-yl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

- 15 3-(2-chlorophenyl)-9-cyclopentyl-5,6-dihydro-7-ethyl-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-iodophenyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

- 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-trifluoromethylphenyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine; and
- 20

5,6-dihydro-7-ethyl-9-(4-fluorophenyl)-3-(1-methylcyclohex-1-yl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine;

and the pharmaceutically acceptable salts and solvates thereof.

- 25 Especially preferred selective PDE4 inhibitors for use in the invention include 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine and 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9H-pyrazolo[3,4-c]-1,2,4-triazolo[4,3- α]pyridine and the pharmaceutically acceptable salts and solvates thereof.

Suitable anticholinergic agents for use in the invention include an ipratropium or an oxitropium salt.

A tiotropium salt (see EP418716 B1) has the structure of formula (1.1):

5

(1.1)

wherein X⁻ is a physiologically acceptable anion.

10

An ipratropium salt (see EP309464 B1) has the structure of formula (1.2):

(1.2)

15

wherein X⁻ is a physiologically acceptable anion.

An oxitropium salt (see EP579615 B1) has the structure of formula (1.3):

(1.3)

wherein X^- is a physiologically acceptable anion.

5

Examples of suitable salt forms of ipratropium and oxitropium are fluoride, F^- ; chloride, Cl^- ; bromide, Br^- ; iodide, I^- ; methanesulfonate, $CH_3S(=O)_2O^-$; ethanesulfonate, $CH_3CH_2S(=O)_2O^-$; methylsulfate, $CH_3OS(=O)_2O^-$; benzene sulfonate, $C_6H_5S(=O)_2O^-$; and *p*-toluenesulfonate, 4-
 10 $CH_3-C_6H_4S(=O)_2O^-$. The bromide salt form is preferred.

Specific preferred combinations of a selective PDE4 inhibitor and an anticholinergic agent for use in the invention include:

- 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-
 15 triazolo[4,3-*a*]pyridine, or a pharmaceutically acceptable salt or solvate thereof and an ipratropium salt or solvate thereof;
 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or a pharmaceutically acceptable salt or solvate thereof and an ipratropium salt, or solvate thereof;
 20 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine, or a pharmaceutically acceptable salt or solvate thereof and an oxitropium salt, or solvate thereof; and
 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or a pharmaceutically acceptable salt or solvate thereof
 25 and an oxitropium salt or solvate thereof.

A selective PDE4 inhibitor or an anticholinergic compound used in accordance with the invention may optionally be utilised in the form of a pharmaceutically acceptable salt or solvate. Such a salt may be an acid addition or a base salt.

- 5 Suitable acid addition salts are formed from acids which form non-toxic salts and examples are the hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, nitrate, phosphate, hydrogen phosphate, acetate, maleate, fumarate, lactate, tartrate, citrate, gluconate, succinate, saccharate, benzoate, methanesulphonate, ethanesulphonate, benzenesulphonate,
10 p-toluenesulphonate and pamoate salts.

Suitable base salts are formed from bases which form non-toxic salts and examples are the sodium, potassium, aluminium, calcium, magnesium, zinc and diethanolamine salts.

15

For a review on suitable salts see Berge et al, J. Pharm. Sci., 66, 1-19, 1977.

- The pharmaceutically acceptable solvates of the selective PDE4 inhibitors and anticholinergic compounds used in accordance with the invention, or salts
20 thereof, include the hydrates thereof.

The selective PDE4 inhibitors and anticholinergic compounds of the invention may exist in one or more polymorphic forms.

- 25 The selective PDE4 inhibitors and anticholinergic agents of the invention (henceforth, 'compounds of the invention') may contain one or more asymmetric carbon atoms and therefore exists in two or more stereoisomeric forms. Where such a compound contains an alkenyl or alkenylene group, cis/trans (or Z/E) isomerism may also occur. The present invention includes these individual
30 stereoisomers of the compounds of the invention and, where appropriate, the individual tautomeric forms thereof, together with mixtures thereof.

Separation of diastereoisomers or cis and trans isomers may be achieved by conventional techniques, e.g. by fractional crystallisation, chromatography or

H.P.L.C. of a stereoisomeric mixture of a compound of the invention or a suitable salt or derivative thereof. An individual enantiomer of a compound of the invention may also be prepared from a corresponding optically pure intermediate or by resolution, such as by H.P.L.C. of the corresponding racemate using a
5 suitable chiral support or by fractional crystallisation of the diastereoisomeric salts formed by reaction of the corresponding racemate with a suitable optically active acid or base, as appropriate.

The present invention also includes all suitable isotopic variations of a compound
10 of the invention or a pharmaceutically acceptable salt thereof. An isotopic variation of a compound of the invention or a pharmaceutically acceptable salt thereof is defined as one in which at least one atom is replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Examples of isotopes that can be incorporated
15 into compounds of the invention and pharmaceutically acceptable salts thereof include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine and chlorine such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{17}O , ^{18}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F and ^{36}Cl , respectively. Certain isotopic variations of the compounds of the invention and pharmaceutically acceptable salts thereof, for example, those in which a
20 radioactive isotope such as ^3H or ^{14}C is incorporated, are useful in drug and/or substrate tissue distribution studies. Tritiated, i.e., ^3H , and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with isotopes such as deuterium, i.e., ^2H , may afford certain therapeutic advantages resulting from greater metabolic stability, for example,
25 increased *in vivo* half-life or reduced dosage requirements and hence may be preferred in some circumstances.

The types of diseases that may be treated using the combinations of the present invention include, but are not limited to, asthma, chronic or acute
30 bronchoconstriction, chronic bronchitis, small airways obstruction, emphysema, chronic obstructive pulmonary disease (COPD), COPD that has chronic bronchitis, pulmonary emphysema or dyspnea associated therewith and COPD that is characterised by irreversible, progressive airways obstruction.

Asthma

One of the most important respiratory diseases treatable with the combinations of therapeutic agents of the present invention is asthma, a chronic, increasingly common disorder encountered worldwide and characterized by intermittent reversible airway obstruction, airway hyper-responsiveness and inflammation. The cause of asthma has yet to be determined, but the most common pathological expression of asthma is inflammation of the airways, which may be significant even in the airways of patients with mild asthma. This inflammation drives reflex airway events resulting in plasma protein extravasation, dyspnea and bronchoconstriction. Based on bronchial biopsy and lavage studies it has been clearly shown that asthma involves infiltration by mast cells, eosinophils, and T-lymphocytes into a patient's airways. Bronchoalveolar lavage (BAL) in atopic asthmatics shows activation of interleukin (IL)-3, IL-4, IL-5 and granulocyte/macrophage-colony stimulating factor (GM-CSF) that suggests the presence of a T-helper 2 (Th-2)-like T-cell population.

The combinations of therapeutic agents of the present invention are useful in the treatment of atopic and non-atopic asthma. The term "atopy" refers to a genetic predisposition toward the development of type I (immediate) hypersensitivity reactions against common environmental antigens. The most common clinical manifestation is allergic rhinitis, while bronchial asthma, atopic dermatitis, and food allergy occur less frequently. Accordingly, the expression "atopic asthma" as used herein is intended to be synonymous with "allergic asthma", *i.e.*, bronchial asthma which is an allergic manifestation in a sensitized person. The term "non-atopic asthma" as used herein is intended to refer to all other asthmas, especially essential or "true" asthma, which is provoked by a variety of factors, including vigorous exercise, irritant particles, psychologic stresses, *etc.*

Chronic Obstructive Pulmonary Disease (COPD)

The combinations of therapeutic agents of the present invention are further useful in the treatment of COPD or COAD including chronic bronchitis, pulmonary emphysema or dyspnea associated therewith. COPD is characterised by poorly reversible, progressive airways obstruction. Chronic bronchitis is associated with hyperplasia and hypertrophy of the mucus secreting glands of the submucosa in

the large cartilaginous airways. Goblet cell hyperplasia, mucosal and submucosal inflammatory cell infiltration, edema, fibrosis, mucus plugs and increased smooth muscle are all found in the terminal and respiratory bronchioles. The small airways are known to be a major site of airway obstruction. Emphysema is characterized by destruction of the alveolar wall and loss of lung elasticity. A number of risk factors have also been identified as linked to the incidence of COPD. The link between tobacco smoking and COPD is well established. Other risk factors include exposure to coal dust and various genetic factors. See Sandford *et al.*, "Genetic risk factors for chronic obstructive pulmonary disease," *Eur. Respir. J.* **10** 1380-1391, 1997. The incidence of COPD is increasing and it represents a significant economic burden on the populations of the industrialized nations. COPD also presents itself clinically with a wide range of variation from simple chronic bronchitis without disability to patients in a severely disabled state with chronic respiratory failure.

COPD is characterized by inflammation of the airways, as is the case with asthma, but the inflammatory cells that have been found in the bronchoalveolar lavage fluid and sputum of patients are neutrophils and macrophages rather than eosinophils. Elevated levels of inflammatory mediators are also found in COPD patients, including IL-8, LTB₄, and TNF- α , and the surface epithelium and sub-epithelium of the bronchi of such patients has been found to be infiltrated by T-lymphocytes and macrophages. Symptomatic relief for COPD patients can be provided by the use of β -agonist and anticholinergic bronchodilators, but the progress of the disease remains unaltered. COPD has been treated using theophylline, but without much success, due in part to its propensity to produce unwanted effects. Steroids have also failed to hold out much promise as satisfactory treatment agents in COPD as they are relatively ineffective as anti-inflammatory agents.

Accordingly, the use of the combinations of therapeutic agents of the present invention to treat COPD and its related and included obstructed airways diseases, represents a significant advance in the art. The present invention is not limited to any particular mode of action or any hypothesis as to the way in

which the desired therapeutic objectives have been obtained by utilizing the combinations of therapeutic agents of the present invention.

Bronchitis and Bronchiectasis

5 In accordance with the particular and diverse inhibitory activities described above that are possessed by the combinations of therapeutic agents of the present invention, they are useful in the treatment of bronchitis of whatever type, etiology, or pathogenesis, including, e.g., acute bronchitis which has a short but severe course and is caused by exposure to cold, breathing of irritant substances, or an
10 acute infection; catarrhal bronchitis which is a form of acute bronchitis with a profuse mucopurulent discharge; chronic bronchitis which is a long-continued form of bronchitis with a more or less marked tendency to recurrence after stages of quiescence, due to repeated attacks of acute bronchitis or chronic general diseases, characterized by attacks of coughing, by expectoration either scanty or
15 profuse, and by secondary changes in the lung tissue; dry bronchitis which is characterized by a scanty secretion of tough sputum; infectious asthmatic bronchitis which is a syndrome marked by the development of symptoms of bronchospasm following respiratory tract infections in persons with asthma; productive bronchitis which is bronchitis associated with a productive cough.

20

The use of the combinations of therapeutic agents of the present invention to treat atopic asthma or non-atopic asthma, COPD or other chronic inflammatory airways diseases may be established and demonstrated by use of a number of different models known in the art of inhibition of reflex events in the airway
25 including plasma extravasation and bronchospasmolytic models described below.

Bronchodilator Activity - cAMP is involved not only in smooth muscle relaxation, but also exerts an overall inhibitory influence on airway smooth muscle proliferation, both of which may result from elevation of cAMP by the PDE4
30 component of the invention. Airway smooth muscle hypertrophy and hyperplasia can be modulated by cAMP, and these conditions are common morphological features of chronic asthma.

Bronchospasmolytic Activity In Vitro - The ability of the combinations of therapeutic agents of the present invention to cause relaxation of guinea-pig tracheal smooth muscle is demonstrated in the following test procedure. Guinea-pigs (350-500 g) are killed with sodium pentothal (100 mg/kg i.p.). The trachea is dissected and a section 2-3 cm in length is excised. The trachea is transected in the transverse plane at alternate cartilage plates so as to give rings of tissue 3-5 mm in depth. The proximal and distal rings are discarded. Individual rings are mounted vertically on stainless steel supports, one of which is fixed at the base of an organ bath, while the other is attached to an isometric transducer. The rings are bathed in Krebs solution (composition μM : NaHCO_3 25; NaCl 113; KCl 4.7; $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ 1.2; KH_2PO_4 1.2; CaCl_2 2.5; glucose 11.7) at 37°C and gassed with O_2/CO_2 (95:5, v/v). Rings prepared in this manner are contracted by field stimulation. To ascertain spasmolytic activity, test combinations of therapeutic agents of the present invention are dissolved in physiological saline and added in increasing quantities to the organ bath at 5m intervals to provide a cumulative concentration-effect curve.

In the above test model, combinations of therapeutic agents of the present invention inhibit field stimulated contraction of guinea-pig tracheal ring preparations at concentrations in the range of from 0.001 to 1.0 μM .

Ozone-induced bronchial hyperreactivity model - The ability of combinations of therapeutic agents of the present invention to prevent increased responsiveness of the airways to noxious stimuli, also known as bronchial hyperreactivity, is demonstrated in the determination of the effects of these agents on activity of lung responsiveness in guinea-pigs. Adult guinea-pigs (300-600g) are pretreated and prepared according to the method Yeadon et al, 1992, *Pulm. Pharmacology*, 5, 101-112. Responsiveness of the airways to a variety of stimuli are monitored at basal state and after various interventions which result in changes in pulmonary mechanics. Test articles were administered i.t. or by aerosol at various times prior to challenge. Ozone pretreatment in control animals resulted in a 3-100x increase in lung responsiveness which was dose-relatedly blocked by combinations of the therapeutic agents of the invention.

In the above test model the combinations of therapeutic agents of the present invention exhibit anti-inflammatory activity at dosages in the range of from 0.001 to 0.3 mg/kg i.t..

- 5 Relaxation of Human Bronchus - Samples of human lungs dissected during surgery for cancer are obtained within 3 days after removal. Small bronchi (inner diameter \approx 2 to 5 mm) are excised, cut into segments and placed in 2 ml liquid nitrogen storage ampoules filled with fetal calf serum (FCS) containing 1.8M dimethylsulfoxide (DMSO) and 0.1M sucrose as cryoprotecting agents. The
- 10 ampoules are placed in a polystyrol box (11 x 11 x 22 cm) and slowly frozen at a mean cooling rate of about 0.6°C/m in a freezer maintained at -70°C. After 3-15h the ampoules are transferred into liquid nitrogen (-196°C) where they are stored until use. Before use the tissues are exposed for 30-60m to -70°C before being thawed within 2.5m by placing the ampoules in a 37°C water bath. Thereafter
- 15 the bronchial segments are rinsed by placing them in a dish containing Krebs-Henseleit solution (μ M: NaCl 118, KCl 4.7, MgSO₄ 1.2, CaCl₂ 1.2, KH₂PO₄ 1.2, NaHCO₃ 25, glucose 11, EDTA 0.03) at 37°C, cut into rings and suspended in 10 ml organ baths for isometric tension recording under a preload of about 1g. Further increases in tension are induced via the application of field stimulation,
- 20 which is known to induce activation of nerves in the airway sample and generate tension via release of acetylcholine and other neurally derived mediators. Concentration-response curves are produced by cumulative additions, each concentration being added when the maximum effect has been produced by the previous concentration. Papaverine (300 μ M) is added at the end of the
- 25 concentration response curve to induce complete relaxation of the bronchial rings. This effect is taken as 100% relaxation.

In the above test model the combinations of therapeutic agents of the present invention produce concentration-related relaxation of human bronchus ring

30 preparations at concentrations in the range of from 0.001 to 1.0 μ M with preferred embodiments being active at concentrations in the range of from 5.0 nM to 500 nM.

Suppression of Capsaicin-induced Bronchoconstriction - Male Dunkin-Hartley guinea-pigs (400-800g) having free access to food and water prior to the experiment, are anaesthetized with sodium phenobarbital (100 mg/kg i.p. [intra peritoneal]). Animals, maintained at 37°C with a heated pad, controlled by a rectal thermometer, are ventilated via a tracheal cannula (about 8 ml/kg, 1 Hz) with a mixture of air and oxygen (45:55 v/v). Ventilation is monitored at the trachea by a pneumotachograph connected to a differential pressure transducer in line with the respiratory pump. Pressure changes within the thorax are monitored directly via an intrathoracic cannula, using a differential pressure transducer so that the pressure difference between the trachea and thorax can be measured and displayed. From these measurements of air-flow and transpulmonary pressure, both airway resistance (R_1 cmH₂O/l/s) and compliance (C_{dyn}) are calculated with a digital electronic respiratory analyzer for each respiratory cycle. Blood pressure and heart rate are recorded from the carotid artery using a pressure transducer.

When values for basal resistance and compliance are stable, an acute episode of bronchoconstriction is induced by an intravenous bolus of capsaicin. Capsaicin is dissolved in 100% ethanol and diluted with phosphate buffered saline. Test combinations of therapeutic agents of the present invention are administered when the response to capsaicin is stable, which is calculated to be after 2-3 such administrations at 10 min intervals. Reversal of bronchoconstriction is assessed over 1-8 h following either intratracheal or intraduodenal instillation or intravenous bolus injection. Bronchospasmolytic activity is expressed as a % inhibition of the initial, maximal resistance (R_D) following the infusion of capsaicin. ED_{50} values represent the dose which causes a 50% reduction of the increase in resistance induced by capsaicin. Duration of action is defined as the time in minutes where bronchoconstriction is reduced by 50% or more. Effects on blood pressure (BP) and heart rate (HR) are characterized by ED_{20} values; i.e., the doses which reduce BP or HR by 20% measured 5m after administration.

In the above test model the combinations of therapeutic agents of the present invention exhibit bronchodilator activity at dosages in the range of from 0.001 to

0.1 mg/kg *i.t.* [intra tracheal] Further, the combination delivered *i.t.* exhibits an at least additive inhibitory effect on bronchospasm, with each component alone being able to inhibit more than 50% of the observed control response.

- 5 LPS-Induced Lung Neutrophilia - The recruitment to and activation of neutrophils in the lungs is considered an important pathological feature in COPD and in severe asthma. Consequently, inhibition of either or both of these endpoints in animals provides supportive evidence of the utility of the present invention.
- 10 Male Wistar-Albino rats (150-250g) or male Dunkin-Hartley guinea-pigs (400-600g) are pretreated with the test articles alone or in combination by inhalation or intratracheal (*i.t.*) instillation under brief general anaesthesia. After 1-24h after compound administration, animals are challenged with an inhalation aerosol of bacterial lipopolysaccharide (LPS) sufficient to induce over the subsequent 1-24h
- 15 of a pronounced lung neutrophilia. The neutrophilia is assessed by cell counting in bronchial washings or by determination of neutrophil products in lung washings or tissue. In this test system, the therapeutic agents of the present invention exhibit anti-inflammatory activity at doses ranging from 0.0001 to 0.1 mg/kg *i.t.* Unexpectedly, the combination delivered *i.t.* exerts at least an additive effect on
- 20 inflammation, despite the fact that one of the components does not on its own exert a significant anti-inflammatory effect. Further, equivalent anti-inflammatory effects of a high dose of one of the components can be observed with lower doses when used in combination as in this invention, thus minimising systemic unwanted effects.
- 25 Allergic guinea-pig Assay - A test for evaluating the therapeutic impact of the combinations of therapeutic agents of the present invention on the symptom of dyspnea and bronchospasm *i.e.*, difficult or labored breathing and increased lung resistance, and on the symptom of inflammation, *ie*: lung neutrophilia and
- 30 eosinophilia, utilizes Dunkin-Hartley guinea-pigs (400-600 g body weight).

The egg albumin (EA), grade V, crystallized and lyophilized, aluminum hydroxide, and mepyramine maleate used in this test are commercially available. The challenge and subsequent respiratory readings are carried out in a clear plastic

- box with internal dimensions of 10x6x4 inches. The head and body sections of the box are separable. In use the two are held firmly together by clamps, and an airtight seal between the chambers is maintained by a soft rubber gasket. Through the center of the head end of the chamber a nebulizer is inserted *via* an airtight seal and each end of the box also has an outlet. A pneumotachograph is inserted into one end of the box and is coupled to a volumetric pressure transducer which is then connected to a dynograph through appropriate couplers. While aerosolizing the antigen, the outlets are open and the pneumotachograph is isolated from the chamber. The outlets are then closed and the pneumotachograph and the chamber are connected during the recording of the respiratory patterns. For challenge, 2 ml of a 3% solution of antigen in saline is placed in each nebulizer and the aerosol is generated with air from a small diaphragm pump operating at 10 psi and a flow rate of 8 l/m.
- Guinea-pigs are sensitized by injecting subcutaneously and i.p. 1 ml of a suspension containing 1 mg EA and 200 mg aluminum hydroxide in saline. They are used between days 12 and 24 post-sensitization. In order to eliminate the histamine component of the response, guinea-pigs are pretreated i.p. 30min prior to aerosol challenge with 2mg/kg of mepyramine. Guinea-pigs are then exposed to an aerosol of 3% EA in saline for exactly 1m, then respiratory profiles are recorded for a further 30m. Subsequently, lung inflammation is determined post mortem over a period of 1-48h. The duration of continuous dyspnea is measured from the respiratory recordings.
- Test combinations of therapeutic agents of the present invention are generally administered i.t. or by aerosol 0.5-4h prior to challenge. The combinations of compounds are either dissolved in saline or biocompatible solvents. The activity of the compounds is determined on the basis of their ability to decrease the magnitude and duration of symptoms of dyspnea and broncospasm and/or magnitude of lung inflammation in comparison to a group of vehicle-treated controls. Tests of the combinations of therapeutic agents of the present invention are evaluated over a series of doses and an ED₅₀ is derived that is defined as the dose (mg/kg) which will inhibit the duration of symptoms by 50%.

Anti-inflammatory Activity - The anti-inflammatory activity of the combinations of therapeutic agents of the present invention is demonstrated by the inhibition of eosinophil or neutrophil activation. In this assay blood samples (50ml) are collected from non-atopic volunteers with eosinophil numbers ranging between
5 0.06 and $0.47 \times 10^9 \text{ L}^{-1}$. Venous blood is collected into centrifuge tubes containing 5 ml trisodium citrate (3.8%, pH 7.4).

The anticoagulated blood is diluted (1:1, v:v) with phosphate-buffered saline (PBS, containing neither calcium nor magnesium) and is layered onto 15 ml
10 isotonic Percoll (density 1.082 - 1.085 g/ml, pH 7.4), in a 50 ml centrifuge tube. Following centrifugation (30 minutes, 1000 x g, 20°C), mononuclear cells at the plasma/Percoll interface are aspirated carefully and discarded.

The neutrophil/eosinophil/erythrocyte pellet (ca. 5 ml by volume) is gently
15 resuspended in 35 ml of isotonic ammonium chloride solution (NH_4Cl , 155mM; KHCO_3 , 10mM; EDTA, 0.1mM; 0-4°C). After 15 min, cells are washed twice (10 min, 400 x g, 4°C) in PBS containing fetal calf serum (2%, FCS).

A magnetic cell separation system is used to separate eosinophils and
20 neutrophils. This system is able to separate cells in suspension according to surface markers, and comprises a permanent magnet, into which is placed a column that includes a magnetizable steel matrix. Prior to use, the column is equilibrated with PBS/FCS for 1 hour and then flushed with ice-cold PBS/FCS on a retrograde basis via a 20 ml syringe. A 21G hypodermic needle is attached to
25 the base of the column and 1-2 ml of ice cold buffer are allowed to efflux through the needle.

Following centrifugation of granulocytes, supernatant is aspirated and cells are gently resuspended with 100 μl magnetic particles (anti-CD16 monoclonal
30 antibody, conjugated to superparamagnetic particles). The eosinophil/neutrophil/anti-CD16 magnetic particle mixture is incubated on ice for 40 minutes and then diluted to 5 ml with ice-cold PBS/FCS. The cell suspension is slowly introduced into the top of the column and the tap is opened to allow the

cells to move slowly into the steel matrix. The column is then washed with PBS/FCS (35ml), which is carefully added to the top of the column so as not to disturb the magnetically labeled neutrophils already trapped in the steel matrix. Non-labeled eosinophils are collected in a 50ml centrifuge tube and washed (10
5 minutes, 400 x g, 4°C). The resulting pellet is resuspended in 5 ml Hank's balanced salt solution (HBSS) so that cell numbers and purity can be assessed prior to use. The separation column is removed from the magnet and the neutrophil fraction is eluted. The column is then washed with PBS (50ml) and ethanol (absolute), and stored at 4°C.

10

Total cells are counted with a micro cell counter. One drop of lysogenic solution is added to the sample, which after 30s is recounted to assess contamination with erythrocytes. Cytospin smears are prepared on a Shandon Cytospin 2 cytospiinner (100 µl samples, 3 minutes, 500 rpm). These preparations are
15 stained and differential cell counts are determined by light microscopy, examining at least 500 cells. Cell viability is assessed by exclusion of trypan blue.

Eosinophils or neutrophils are diluted in HBSS and pipetted into 96 well microtiter plates (MTP) at $1-10 \times 10^3$ cells/well. Each well contains a 200 µl sample
20 comprising: 100 µl cell suspension; 50 µl HBSS; 10 µl lucigenin; 20 µl activation stimulus; and 20 µl test compound.

The samples are incubated with test compound or vehicle for 10m prior to addition of an activation stimulus fMLP (1-10 µM) or C5a (1-100nM) dissolved in
25 dimethylsulfoxide and thereafter diluted in buffer, such that the highest solvent concentration used is 1% (at 100 µM test compound). MTPs are agitated to facilitate mixing of the cells and medium, and the MTP is placed into a luminometer. Total chemiluminescence and the temporal profile of each well is measured simultaneously over 20m and the results expressed as arbitrary units,
30 or as a percentage of fMLP-induced chemiluminescence in the absence of test compound. Results are fitted to the Hill equation and IC_{50} values are calculated automatically.

The combinations of therapeutic agents of the present invention are active in the above test method at concentrations in the range of from 0.0001 μ M to 0.5 μ M, with preferred embodiments being active at concentrations in the range of from 0.1 nM to 100 nM.

5

The anti-inflammatory activity of the combinations of therapeutic agents of the present invention is additionally demonstrated by the inhibition of plasma extravasation into rat airways. In this assay tracheal tissue is taken and the extent of plasma leakage determined. This assay relates equally to other chronic
10 inflammatory diseases of the airways including but not limited to COPD and accordingly is not recapitulated in that section.

Wistar albino rats (150-200g) or Dunkin-Hartley guinea-pigs (450-600g) are anaesthetised with sodium pentobarbitone and venous and arterial cannulae
15 installed. Evans Blue dye to bind plasma proteins is administered i.v. (30mg/kg). After 10mins the test agents are administered i.t. and 10mins later capsaicin administered i.v. (3ug/kg). 30mins later, tracheal tissue is removed, extracted overnight into formamide and absorbance read at 620nm. In some experiments the order of dosing was reversed such that the compounds were administered
20 before the Evans Blue and inflammatory stimulus.

In the above test model In the above test model the combinations of therapeutic agents of the present invention exhibit anti-inflammatory activity at dosages in the range of from 0.001 to 0.1 mg/kg *i.t.*

25

From the above it may be seen that the combinations of therapeutic agents of the present invention are useful for the treatment of inflammatory or obstructive airways diseases or other conditions involving airways obstruction. In particular they are useful for the treatment of bronchial asthma.

30

In view of their anti-inflammatory activity and their influence on airways hyper-reactivity, the combinations of therapeutic agents of the present invention are

useful for the treatment, in particular prophylactic treatment, of obstructive or inflammatory airways diseases. Thus, by continued and regular administration over prolonged periods of time the combinations of compounds of the present invention are useful in providing advance protection against the recurrence of
5 bronchoconstriction or other symptomatic attack consequential to obstructive or inflammatory airways diseases. The combinations of compounds of the present invention are also useful for the control, amelioration or reversal of the basal status of such diseases.

10 Having regard to their bronchodilator activity the combinations of therapeutic agents of the present invention are useful as bronchodilators, *e.g.*, in the treatment of chronic or acute bronchoconstriction, and for the symptomatic treatment of obstructive or inflammatory airways diseases.

15 Obstructive or inflammatory airways diseases to which the present invention applies include asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive airways or pulmonary disease (COAD or COPD); and adult respiratory distress syndrome (ARDS), as well as exacerbation of airways hyper-reactivity consequent to other drug therapy, *e.g.*, aspirin or β -agonist therapy.

20

The selective PDE4 inhibitors and anticholinergic agents of the present invention can be administered alone or in combination but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier.

25 The selective PDE4 inhibitors and anticholinergic agents of the present invention are preferably administered by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomiser (preferably an atomiser using
electrohydrodynamics to produce a fine mist) or nebuliser, with or without the use
30 of a suitable propellant, *e.g.* dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide, a further perfluorinated hydrocarbon such as Perflubron (trade mark) or other suitable gas. In the case of a pressurised aerosol, the

dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol (optionally, aqueous ethanol) or a suitable agent for dispersing, solubilising or extending release and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules, blisters and cartridges (made, for example, from gelatin or HPMC) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the invention, a suitable powder base such as lactose or starch and a performance modifier such as l-leucine, mannitol or magnesium stearate.

Prior to use in a dry powder formulation or suspension formulation for inhalation a compound of the invention will be micronised to a size suitable for delivery by inhalation (typically considered as less than 5 microns). Micronisation could be achieved by a range of methods, for example spiral jet milling, fluid bed jet milling or use of supercritical fluid crystallisation.

A suitable solution formulation for use in an atomiser using electrohydrodynamics to produce a fine mist may contain from 1 μ g to 10mg of a compound of the invention and the actuation volume may vary from 1 to 100 μ l. A typical formulation may comprise an active compound, propylene glycol, sterile water, ethanol and sodium chloride.

Aerosol or dry powder formulations are preferably arranged so that each metered dose or "puff" contains from 1 to 4000 μ g of a compound of the invention for delivery to the patient. The overall daily dose with an aerosol will be in the range of from 1 μ g to 20mg which may be administered in a single dose or, more usually, in divided doses throughout the day.

The preferred ratio, by weight (w/w), of selective PDE4 inhibitor:anticholinergic agent used will depend on the particular combination being examined. This is due to differences in the potency of individual compounds. The physician in any event will determine the actual dosage of each compound which will be most

suitable for any individual patient and it will vary with the age, weight and response of the particular patient.

It is to be appreciated that all references herein to treatment include curative,
5 palliative and prophylactic treatment.

Claims

1. An inhaled combination of a selective PDE4 inhibitor and an anticholinergic agent, with the proviso that the anticholinergic agent is not a tiotropium salt.
2. A combination as claimed in claim 1 wherein the selective PDE4 inhibitor is a compound of the formula (I)

10

or a pharmaceutically acceptable salt or solvate thereof, wherein:

- R^1 is H, (C_1-C_6) alkyl, (C_1-C_6) alkoxy, (C_2-C_4) alkenyl, phenyl, $-N(CH_3)_2$, (C_3-C_6) cycloalkyl, (C_3-C_6) cycloalkyl (C_1-C_3) alkyl or (C_1-C_6) acyl, wherein the alkyl, phenyl or alkenyl groups may be substituted with up to two $-OH$, (C_1-C_3) alkyl, or $-CF_3$ groups or up to three halogens;

- R^2 and R^3 are each independently selected from the group consisting of H, (C_1-C_{14}) alkyl, (C_1-C_7) alkoxy (C_1-C_7) alkyl, (C_2-C_{14}) alkenyl, (C_3-C_7) cycloalkyl, (C_3-C_7) cycloalkyl (C_1-C_2) alkyl, a saturated or unsaturated (C_4-C_7) heterocyclic $(CH_2)_n$ group wherein n is 0, 1 or 2, containing as the heteroatom one or two of the group consisting of oxygen, sulfur, sulfonyl, nitrogen and NR^4 where R^4 is H or (C_1-C_4) alkyl; or a group of the Formula (II):

25

wherein a is an integer from 1 to 5; b and c are 0 or 1; R^5 is H, $-OH$, (C_1-C_5) alkyl, (C_2-C_5) alkenyl, (C_1-C_5) alkoxy, (C_3-C_6) cycloalkoxy, halogen, $-CF_3$, $-CO_2R^6$, $-CONR^6R^7$, $-NR^6R^7$, $-NO_2$, or $-SO_2NR^6R^7$ wherein R^6 and R^7 are each

independently H, or (C₁-C₄) alkyl; Z is -O-, -S-, -SO₂-, -CO- or -N(R⁸)- wherein R⁸ is H or (C₁-C₄) alkyl; and Y is (C₁-C₅) alkylene or (C₂-C₆) alkenylene optionally substituted with up to two (C₁-C₇) alkyl or (C₃-C₇) cycloalkyl groups; wherein each of the alkyl, alkenyl, cycloalkyl, alkoxyalkyl or heterocyclic groups may be substituted with 1 to 14, preferably 1 to 5, (C₁-C₂) alkyl, CF₃, or halo groups; and R⁹ and R¹⁰ are each independently selected from the group consisting of H, (C₁-C₆) alkyl, (C₁-C₆) alkoxy, (C₆-C₁₀) aryl and (C₆-C₁₀) aryloxy.

3. A combination as claimed in claim 2 wherein the selective PDE4 inhibitor is 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or a pharmaceutically acceptable salt or solvate thereof.

4. A combination as claimed in any one of the preceding claims wherein the anticholinergic agent is an ipratropium or an oxitropium salt.

5. A combination as claimed in claim 1 wherein:

the selective PDE4 inhibitor is 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine, or a pharmaceutically acceptable salt or solvate thereof and the anticholinergic agent is an ipratropium salt or solvate thereof; or

the selective PDE4 inhibitor is 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or a pharmaceutically acceptable salt or solvate thereof and the anticholinergic agent is an ipratropium salt or solvate thereof; or

the selective PDE4 inhibitor is 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(2-thienyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine, or a pharmaceutically acceptable salt or solvate thereof and the anticholinergic agent is an oxitropium salt or solvate thereof; or

the selective PDE4 inhibitor is 9-cyclopentyl-5,6-dihydro-7-ethyl-3-(*tert*-butyl)-9*H*-pyrazolo[3,4-*c*]-1,2,4-triazolo[4,3-*a*]pyridine or a pharmaceutically acceptable salt or solvate thereof and the anticholinergic agent is an oxitropium salt or solvate thereof.

6. A combination as claimed in any preceding claim for use as a medicament.

7. A combination as claimed in any one of claims 1 to 5 for simultaneous, sequential or separate administration by the inhaled route in the treatment of an obstructive airways or other inflammatory disease.
8. A pharmaceutical composition comprising a selective PDE4 inhibitor, an
5 anticholinergic agent and a pharmaceutically acceptable excipient, diluent or carrier, for administration by the inhaled route in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.
9. A pharmaceutical composition, as claimed in claim 8, wherein the
10 selective PDE4 inhibitor and the anticholinergic agent are as defined in any one of claims 2 to 5.
10. The use of a selective PDE4 inhibitor or an anticholinergic agent in the manufacture of a medicament for simultaneous, sequential or separate
15 administration of both agents by the inhaled route in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.
11. The use as claimed in claim 10 wherein the selective PDE4 inhibitor and the anticholinergic agent are as defined in any one of claims 2 to 5.
12. A method of treating of an obstructive airways or other inflammatory
20 disease comprising administering simultaneously, sequentially or separately, by the inhaled route, to a mammal in need of such treatment, an effective amount of a selective PDE4 inhibitor and an anticholinergic agent, with the proviso that the anticholinergic agent is not a tiotropium salt.
13. A method as claimed in claim 12 wherein the selective PDE4 inhibitor and
25 the anticholinergic agent are as defined in any one of claims 2 to 5.
14. An inhalation device for simultaneous, sequential or separate administration of a selective PDE4 inhibitor and an anticholinergic agent in the treatment of an obstructive airways or other inflammatory disease, with the proviso that the anticholinergic agent is not a tiotropium salt.
- 30 15. A device as claimed in claim 14 wherein the selective PDE4 inhibitor and the anticholinergic agent are as defined in any one of claims 2 to 5.

INTERNATIONAL SEARCH REPORT

International Application No

PCT/EP 02/05726

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 A61K45/06 A61P11/00 A61K31/46

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

BIOSIS, EPO-Internal, PAJ, WPI Data, EMBASE

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO 94 29306 A (NEW YORK UNIVERSITY) 22 December 1994 (1994-12-22) claims 1,15 page 12, line 16-26	1
A	WO 96 39408 A (PFIZER) 12 December 1996 (1996-12-12) claims 1-4 --- -/--	2,3

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *Z* document member of the same patent family

Date of the actual completion of the international search

24 September 2002

Date of mailing of the international search report

30/09/2002

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2

INTERNATIONAL SEARCH REPORT

International application No.
PCT/EP 02/05726

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.1

Although claims 12 and 13 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

Continuation of Box I.1

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

Continuation of Box I.2

Present claims 1-3,6-15 relate to a product/compound/method/apparatus defined by reference to a desirable characteristic or property, namely "ANTICHOLINERGIC AGENT"

The claims cover all products/compounds/methods/apparatus having this characteristic or property, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such products/compounds/methods/apparatus. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the product/compound/method/apparatus by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible. Consequently, the search has been carried out for those parts of the claims which appear to be clear, supported and disclosed, namely those parts relating to the products/compounds/methods/apparatus mentioned in claims 4 and 5 with due regard to the general idea underlying the present application.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
